In a paper on Soviet public health, delivered by A. N. Bakulev, president of the Academy of Medical Sciences USSR, at the All-Union Conference of the Aktiv of Public Health Workers, held in Moscow on 23-27 October 1956 and published in Sovetskoye Zdravookhraneniye, the following information is given:

One of the basic problems of modern medicine is the prevention and eradication of the more widespread and serious infectious diseases such as dysentery, influenza and common colds, angina, rheumatism, poliomyelitis, scarlet fever, measles, and whooping cough, which are frequently of an epidemic character and cause serious morbidity. New medications and surgical methods of treatment have, however, considerably decreased the spread of tuberculosis. For the control of dysentery, various antibiotic and chemiotherapeutic preparations have been developed but the disease has not been fully eradicated.

In the control of children's infections, especially poliomyelitis, little progress has been made thus far. At present, a special institute of poliomyelitis has been organized which has prepared an experimental series of antipoliomyelitis vaccines, but the mass production of this vaccine has not been effected.

SYM-1345

U.S.S.R. 1955

New vaccines and serum have been obtained for the treatment of enteric encephalitis, brucellosis, and tularemia; new diagnostic preparations have been developed for the early diagnosis of diphtheria, enteric infections, tularemia, etc. Infectionists and microbiologists, however, have not improved the control of infectious diseases, and little work has been done on developing polyvalvaccines. More research has been done, however, on cardiovascular diseases and cardiovascular surgery.

Work on the development of new antibiotics has been progressing slowly in the USSR. For example, in the US, 16 institutes are working on the development of new antibiotics, but in the USSR there are only two such institutes.

Considerable success has been achieved in obtaining chemiotherapeutic preparations. According to the Pharmacological Committee of the Ministry of Health USSR, 72 preparations were issued in 1955. However, the production of endocrine and vitamine preparations is not as successful.

The USSR does not now have enough good quality surgical instruments and apparatus.

34M. 1345

LAGLEY, H.A.

Soviet scientific research institutes are not producing as well as desired and one of the basic reasons is because these institutes are housed in buildings not suitable for scientific research. It is necessary, therefore, to construct a special center for the scientific research institutes of the Academy of Medical Sciences USSR.

Considerable shortcomings exist in the planning of scientific research and it is inadequately carried out by the Academy of Medical Sciences, the Scientific Council of the Ministry of Health USSR, the scientific councils of the ministries of health of union-republics, and by the main administrations of the ministries.

Scientific research in chairs of higher educational institutions has declined in the past years, although numerous qualified personnel are employed in these chairs. For example, in the 200 scientific research institutes there are 763 persons with the degree of doctor of sciences, and in the 87 higher educational institutions, and institutes for the advanced training of physicians there are approximately 1,700 persons with the degree of doctor of sciences, but these personnel are not being fully utilized at present.

Insufficient research is being conducted in hospitals and sanitary-epidemiological stations, even in the major hospitals. No funds are allocated for research in hospitals, and even biochemical and bacteriological laboratories cannot conduct research.

SUM.1345

UNCLASSIFIED

Sanitary conditions in the USSR need improvement. The State Sanitary Inspectorate should be transferred from subordination of the Ministry of Health USSR to subordination of the Council of Ministers USSR. This will significantly raise the role of sanitary inspection and sanitary work. It is also necessary to retain the independent organization of sanitary-epidemiological stations, which are basic institutions for sanitary-epidemiological work and prophylaxis. The role of the sanitation physician must be raised. A special institute for school hygiene must be organized where specialists, scientists, and physical culturists can properly educate school children in maintaining public health.

The problems confronting medical science are of considerable concern. To minimize these, it becomes necessary to reorganize the direction of scientific research. The Ministry of Health USSR and the Academy of Medical Sciences USSR are now developing measures for transferring the planning of medical science to the Academy of Medical Sciences. Closer ties must be developed between the USSR and foreign countries in scientific fields, especially through personal contact and literature exchange.

It is now necessary to organize an independent Ministry of Medical Industry which will be responsible for the production of medicines, medical apparatus, and instruments necessary for practical public health and scientific research institutions.

54M.1845

ENCLOSURE A.A.

The Soviet government must transfer from the Ministry of Instrument Building and Automation Equipment, the Ministry of Meat and Dairy Products, and the Ministry of Chemical Industry to the Ministry of Health USSR those institutions which fulfill orders directly and exclusively for the requirements of the Ministry of Health USSR. (Sovetskaya Zdravookhraneniye, No 1, Jan 57, pp 39-43) (U)

"Contemporary Problems of Vascular Surgery," by A. N. Bakulev, Active Member of the Academy of Medical Sciences USSR, and Prof Ye. N. Meshalkin, Institute of Thoracic Surgery (director, Prof A. N. Bakulev), Academy of Medical Sciences USSR and Faculty Surgical Clinic imeni S. I. Spasokukotskiy (head, Prof A. N. Bakulev), of the Second Moscow Medical Institute imeni I. V. Stalin, Vestnik Khirurgii imeni Grekova, Vol 77, No 11, Nov 56, pp 43-51

This article discusses general problems of vascular surgery, including successes in the diagnosis of blood-vessel diseases, modern techniques of surgical operations for the connection and terminal closure of vessels, and modern technique for vascular suturing. Diagrams illustrate the method of suturing. Another major part of the article covers essential groups of operations on blood vessels, which includes operations for rerouting of arteries, operations for the restoration of normal anatomic structures of the vascular bed, operations for creating collateral circulation, operations for "hemodynamic redistribution," and finally operations for the replacement of blood vessels.

Plastic vascular surgery is progressing fast due to improve anti-coagulant drugs, the application of stored homografts, and especially vascular prosthesis. Large plastic correction of vascular damage is possible and results in both perfect anatomic outcome and physiological functions. (U)

303. TREATMENT OF ACUTE LUNG ABSCESES (Russian text). Bakulev A. N. and Kolesnikov S. A. KHIRURGIYA 1957, 5 (17-23) Illus. 4

The usual method of surgical treatment is pneumotomy. The time limits for this operation, in the opinion of the majority of physicians and surgeons, is established to be 6-12 weeks after the beginning of the disease; following this treatment recovery is noted in 50-75% of cases. However, the study of remote results of conservative treatment of lung abscesses shows that this figure is exaggerated. Expectant tactics in presence of abscesses of the lungs has no theoretical basis. In practice such treatment frequently results in grave complications, such as gangrene, appearance of numerous abscesses, purulent metastases, empyema, haemorrhage, etc. Often the use of antibiotics only obscures the clinical course of the abscess and conceals its transformation into the chronic form. Surgical treatment in late stages still gives a high lethality rate (from 12 to 34% according to different authors). The earlier the operation is performed, the lower the mortality. All the above shows that the tactics of treatment of acute lung abscesses should be revised. Pneumotomy should be performed at the earliest possible date. When gangrene sets in incision and drainage of the necrotic area of the lung tissue should be performed before the appearance of a cavity. The authors consider that the most effective method of pneumotomy is debridement of the focus with sealed (underwater) drainage. In the absence of pleural adhesions, this operation should be performed in one stage. The lung is to be sutured to the intercostal muscles around the supposed place of incision of the abscess. In correct operative technique with simultaneous administration of antibiotics incision of the pleural cavity is not dangerous. The authors' conclusions are supported by personal observations.

4826. EEG AS AN OBJECTIVE METHOD OF CONTROLLING THE DEPTH OF ANAESTHESIA (Russian text) - Bakulev A. N. and Efunt S. N. - KHIRURGIYA 1958, 6 (21-26) Graphs 6

EEG control of the depth of anaesthesia was used in 26 patients under ether anaesthesia. Regular changes of cerebral biocurrents were detected depending on the stage of anaesthesia. The changes were found in the EEG curve before it was possible to detect any clinical signs. An overdose of ether was registered by the EEG method much earlier than it was manifested clinically. At times disorders in the anaesthetic apparatus could be promptly rectified due to the timely EEG signs. This method is valuable, especially with the employment of relaxants. (IX, 8)
